Guide Index

Reading guides for **retroarch-macos-arcade-setup**, a RetroArch setup for Apple Silicon Macs with native cores, CRT shaders and a multi-core MAME playlist. Each guide is a single continuous page; start with the Quick Start.

1. Quick Start

Requirements, cloning the repository, running `install.sh`, the first launch and how to check the install worked.

2. ROMs

The folder for each system, the file formats each core accepts, zips, CD images (`.chd`, `.cue` / `.bin`, `.m3u`), playlists and automatic box art.

3. MAME and Arcade

Which romset MAME 2003-Plus and MAME 2010 expect, why MAME zips stay untouched, merged/split/non-merged sets, CHDs, samples and diagnosing games that do not start.

4. BIOS Files

The exact system folder, a table of every BIOS file with its MD5 and whether it is required, and how to verify them from RetroArch or the Terminal.

5. Backup and Restore

What the repository does not store, what can be downloaded again, `backup.sh` / `restore.sh`, and rebuilding everything on a freshly formatted Mac.

6. Troubleshooting and FAQ

Slow games and the video driver rule, missing BIOS, MAME games that fail, missing box art, unresponsive controls and reading the log.

7. ES-DE Frontend

The game browser `install.sh` sets up, copying playlists and artwork into it, scraping videos with ScreenScraper, themes, controls and choosing a core per game.

How these guides are made

The guides are written in Markdown in `docs/guides/src/` and turned into PDFs by `docs/build-guides.sh`, which renders each one in a headless Chrome and sets the page height to the height of the content. Edit the Markdown and run the script to regenerate them.

Released under the MIT license as part of retroarch-macos-arcade-setup. No ROMs, BIOS files or other copyrighted material are included.
